

**Figure 5.** Imaging work-up in patients with adrenal incidentaloma. This figure is designed to provide overall general guidance as it is not possible to account for every clinical eventuality in a single figure; MDT discussion is especially important in any cases of doubt. <sup>1</sup>Additional imaging can vary according to the center expertise and availability including FDG-PET/CT, adrenal MRI with CSI, or washout CT. <sup>2</sup>In case of bilateral lesions with similar imaging feature, biopsy could be considered (see also R.6.3.5). <sup>3</sup>After complete tumor staging including CT thorax, abdomen and pelvis.
